Florence, Italy**

Photonics Walking Up a Human Hair

I will report on a new research line in which nano photonics is combined with deformable micro structures. In particular, I will discuss how liquid crystal elastomers can be used to make deformable photonic components, where light induces structural deformations that feed back on the optical properties of the structure. Also I will show how such concepts can be used to make functional microscopic structures that can perform simple tasks and move around (walk/swim), using the environmental light as energy source. Nature is a source of inspiration for many of the designs used in this context.

Notes: Cancelled

Thursday
March 30, 2017
Starts at 12:15 PM
Coffee at 12:00 PM
Physics Conference Room, SB B326
