We are now experiencing a revolution in optical technologies: in the past the state of the art in the field of photonics transitioned from individual miniaturized optical devices to massive optical circuits on a microelectronic chip that can be modified on demand. This revolution is ongoing – new materials and technologies are emerging to control the flow of light in unprecedented ways and it is opening the door to applications that only a decade ago were unimaginable.

Note: Event was cancelled

Monday
March 16, 2020
Starts at 12:15 PM
Coffee at 12:00 PM
Physics Conference Room, SB B326
